## Summary

Senior iOS Engineer with 13 years of experience in consumer apps, from new products built from scratch to a large-scale app used by millions of people. Takes features from product idea through architecture to App Store release, and extracts existing ones into separate modules and an SDK shared across apps. Now focused on AI on iOS: LLM-powered app features and a system for building iOS apps with AI agents.

## Skills

**iOS:** Swift, SwiftUI, UIKit, Objective-C, Swift Concurrency (async/await), Combine, StoreKit 2, CloudKit, watchOS, CarPlay, MVVM, Clean Architecture, Modular Architecture, SDK Development

**Testing & Release:** XCTest, Swift Testing, Unit Testing, Integration Testing, Xcode Instruments, CI/CD, A/B Testing, Feature Flags, Firebase, PostHog

**AI:** AI-Assisted Development, Agentic Engineering, Claude Code, Codex, MCP, LLM Integration

## Experience

**Senior iOS Engineer | Independent** | Kyiv, Remote | Jul 2026 - Present

*Agentic SDLC for iOS | A framework for AI-driven iOS development*

AI agents plan, implement, and test each iOS feature through to App Store release. Designed and built the system.

- Used it to ship two App Store apps: DriveCheckUA, a CarPlay safety app with an on-device AI summary, and OneCart Family, a family shopping list shared through iCloud.
- Set up one build-and-test gate that runs every iOS change the same way locally and in CI.
- Accepted each feature only after checking its test evidence and a separate agent's review. In DriveCheckUA, a requirement without a test fails the build.

*Swift, SwiftUI, Agentic Engineering, Coding Agents, LLM Integration*

**Senior iOS Engineer | GlobalLogic (contract)** | Kyiv, Remote | Jan 2026 - Jul 2026

*AI voice assistant on Apple Watch*

An R&D demo for the customer's executives: a hands-free assistant that let field workers report status and ask questions by voice. Owned the watch app end to end.

- Built the voice interface on the watch and mapped structured LLM responses to on-screen actions, alerts, and haptics.
- Developed work-site maps for the watch with hazard areas and compass-guided navigation, plus arrival detection on the iPhone.
- Designed and implemented the emergency flow on watchOS.
- Implemented real-time audio streaming between the watch and the AI backend through an iPhone relay.

*Voice AI, LLM Integration, Structured Outputs, SwiftUI, WatchKit, WatchConnectivity, WebSockets*

**Senior iOS Engineer | PASHA Holding** | Kyiv, Remote | Apr 2022 - Jan 2026

*Birmarket | Online marketplace*

Birmarket started as Umico and grew to 2M+ customers. On the Loyalty team, built Premium Subscription and expanded it from a single feature into a full module.

- Built marketplace features across the app in UIKit and SwiftUI, including deep-link navigation, and migrated 15+ screens from UIKit to SwiftUI.
- Extracted feature modules and shared infrastructure into Swift packages as the team modularized the monolith, and fixed performance issues in the legacy code: memory leaks from retain cycles and UI hangs.
- Rebuilt Premium Subscription as a Swift package SDK with SwiftUI and Clean Architecture, then shipped it in three apps: the marketplace, a banking app, and a payment wallet.
- Reviewed code, onboarded new iOS engineers, and set up feature flags and A/B tests, including those behind a new subscription onboarding that raised new-subscriber conversion.
- Took on-call crash-monitoring shifts, with the crash-free rate above 99.9%.

*SwiftUI, UIKit, Combine, Swift Concurrency (async/await), Swift Package Manager (SPM), SDK Development, Clean Architecture, MVVM, CI/CD, Integration Testing, A/B Testing, PostHog, APNs*

**Senior iOS Engineer | Drinkit** | **Kyiv, Remote | Feb 2020 - Feb 2022**

*Drinkit app | Digital-first coffee brand*

Drinkit is an app-first coffee brand, now with 250+ coffee shops. Brought an existing mobile team into Drinkit and built the iOS app with it from scratch alongside product, design, and backend.

- Shipped the menu, ordering, and pickup flows in UIKit for the opening of the first coffee shop, and kept developing the app, which handled nearly all orders, as the chain grew to eight shops.
- Built much of the drink customization, including client-side price calculation.
- Owned the dynamic menu, the app's signature feature: client-side logic that built each customer's menu from the backend catalog by preference and time of day, with looping drink videos cached offline.
- Ran App Store releases, set up the release CI pipeline, and wrote unit tests for pricing and cart state.

*Swift, UIKit, GCD, MVP (Model-View-Presenter), AVFoundation, Payment SDK Integration, Unit Testing, GitLab CI, A/B Testing*

**Senior iOS Engineer | SOLVVE** | **Kyiv, On-site | Jan 2019 - Feb 2020**

*PLAYHERA | Esports tournament platform*

PLAYHERA was an international esports platform for organizing online tournaments. Developed features for the existing iOS app on the product team.

- Added tournament-management features in UIKit within the app's feature-module architecture.
- Reviewed teammates' code and contributed to App Store releases.

*Swift, UIKit, Auto Layout, Code Review*

**iOS Developer | Early commercial work** | **Kyiv | Dec 2013 - Nov 2018**

Started in Objective-C and moved to Swift. Worked both as the only iOS developer, taking apps from requirements to release, and in product teams on existing codebases. Projects covered consumer, fintech, healthcare, and e-commerce apps, plus Bluetooth hardware R&D. Shipped most of them to the App Store and kept several updated after release.

- Implemented map and location features, an interactive 3D body model, audio playback, offline records, and a payment checkout.

*Objective-C, Swift, SnapKit, CoreBluetooth, SceneKit, Core Data, Core Location, Apple Pay, Stripe*
