Senior iOS Engineer | Agentic Engineering & Agent-Ready Apps

vil4max@gmail.com | linkedin.com/in/vil4max | github.com/vil4max | t.me/vil4max

Summary

Senior iOS Engineer who takes features and whole apps from idea to a stable App Store release: 13 years in product development, six of them senior, on fintech, marketplace, and consumer apps. Runs an agentic, AI-assisted development process with independent review and tests on every change, and can bring it to a team. At Birmarket, a marketplace with more than 2 million customers, turned the subscription feature into a white-label SDK for three host apps (marketplace, bank, and payment wallet), architected to the bank's Clean Architecture standard. Before that, launched Drinkit from concept to its first coffee shop; the chain now runs 250+ locations in five countries.

Skills

Core: Swift, SwiftUI, UIKit, Objective-C, Swift Concurrency, Actors, Sendable, Combine, GCD

Native iOS: Auto Layout, Core Data, URLSession, REST APIs, WebSockets, Keychain, APNs, Background Tasks, StoreKit 2, In-App Subscriptions

Architecture: MVVM, Clean Architecture, Modular Architecture, SPM, DI

Quality & Delivery: XCTest, Unit Testing, Integration Testing, Xcode Instruments, CI/CD, Git, TestFlight, A/B Testing, Agile

Libraries: Alamofire, Moya, SnapKit, Swinject, RxSwift, Firebase, PostHog

AI: Agentic SDLC, AI-Assisted Development, Claude Code, Codex, MCP, Apple Foundation Models

Experience

Senior iOS Engineer | Independent | Kyiv, Remote | Jun 2026 - Present

Stampwork | Spec-driven iOS delivery with coding agents

Directs several coding agents that write the code and tests; approves requirements and each iteration's plan, authorizes commits, and accepts each feature after reviewing the evidence.

- Built Stampwork for spec-driven iOS feature delivery: a coding agent implements approved requirements, and every change passes an automated gate (format, lint, build, tests) and an independent review.
- Developing its toolkit: a runtime added to each app with a stable command API, environment checks, the build-and-test gate, and tracing from each requirement to its tests.
- Shipped three apps through this process: DriveCheckUA (iPhone and CarPlay) and OneCart Family on the App Store, and PitStop on TestFlight, with features including on-device Foundation Models with structured output and deterministic fallback, CloudKit sharing with offline-first sync, widgets, App Intents, and Live Activities.

Swift, SwiftUI, Agentic SDLC, Coding Agents, Apple Foundation Models

Senior iOS Engineer | GlobalLogic (contract) | Kyiv, Remote | Jan 2026 - Jun 2026

Voice AI assistant on Apple Watch

Designed and built the key watchOS flows and shaped the client architecture with the wider team. Took the watch client and its iPhone relay from design to a working demo for the customer's executives.

- Constrained model output to safe actions: structured responses map onto known screens and alerts instead of executing model instructions.
- Built the iPhone relay that carries the watch's live audio and WebSocket traffic.
- Evaluated an AI-assisted delivery workflow against written requirements and visual references.

SwiftUI, WatchKit, WatchConnectivity, WebSockets, AVFoundation, VelocityAI, Structured Outputs

Senior iOS Engineer | PASHA Holding | Kyiv, Remote | Apr 2022 - Jan 2026

Birmarket | Marketplace shopping and loyalty

Birmarket, formerly Umico, is a consumer marketplace in the PASHA ecosystem serving more than 2 million customers. Joined while the mobile team was still small and grew with it into several feature teams within a cross-

functional organization of about 100 people: mobile, backend, QA, business analysts, DevOps, and product. Grew from feature development to platform architecture across the ecosystem's apps.

- Extracted Premium Subscription from the Birmarket app (30+ modules) into a Swift Package SDK built in SwiftUI for three host apps, designing the architecture and host contract alone while delivering loyalty features.
- Shipped features across the whole app (home, promotions, cart, delivery, profile, loyalty, subscription) in UIKit and SwiftUI for four years and through the Umico-to-Birmarket redesign.
- Maintained the stability and code quality of a production app on a two-week release cycle: on-call crash response, leak and hang fixes, code review, and onboarding of two engineers.

SwiftUI, UIKit, Combine, Swift Concurrency, SPM, Multi-host SDK, Clean Architecture, CI/CD, A/B Testing, PostHog, APNs

Senior iOS Engineer | Drinkit | Kyiv, Remote | Feb 2020 - Feb 2022

Dodo Brands | Digital coffee shop

A concept for a personalized digital coffee shop that has since grown into a chain across five countries. Worked in a product team of about 20 across engineering, design, QA, and product. Brought in the mobile team and worked as a product-oriented iOS engineer across menu, ordering, and pickup. Grew the app alongside the chain during its first two years, from one shop to eight.

- Shaped customer scenarios into product features with management, product, and design, from the first concept to launch.
- Implemented and shipped the dynamic menu: a client-side constructor that assembles a personal menu by time of day, location, and customer preferences.
- Shared responsibility for delivery: chose the architecture with the other iOS engineers, built drink customization and pricing, integrated the payment SDK, set up the GitLab CI release workflow, and took releases to the App Store.

Swift, UIKit, Combine, GCD, MVP, AVFoundation, Payment SDKs, Unit Testing, GitLab CI, A/B Testing

iOS Developer | Early commercial work | Kyiv | Dec 2013 - Feb 2020

PLAYHERA | Electus | Clovis | AcuCharting | Tap4Parking | AlphaSMS

Started in 2013 with small Objective-C apps for messaging, news, and parking services. Grew through healthcare, retail, and Bluetooth hardware projects for startups and agencies, most of them built from scratch and released on the App Store. Moved into Swift, reactive programming, and VIPER while working in established team codebases. Built the engineering base for senior product work.

Objective-C, Swift, SnapKit, Alamofire, CoreBluetooth, RxSwift, VIPER, SceneKit, Core Data, Core Location, Keychain

Startups and R&D

Fintech built inside startups and R&D teams, driven by an interest in making financial products usable without special knowledge, with blockchain kept as infrastructure rather than something the customer has to learn. Both products put the hard parts on the client: secrets, identity, and money.

Electus crypto wallet. A startup product meant as a simple entry to blockchain for people without expertise. Built the iOS app from scratch: wallet creation and import, balances and market charts, secrets stored in Keychain behind Touch ID and Face ID, seed-phrase verification, and Ethereum integration with transaction-state tracking.

Blockchain-backed gold ownership. A prototype for trading physical gold, with ownership recorded on Ethereum and held by the backend. Built the client beta on Combine-driven MVVM: third-party KYC onboarding, portfolio balances in grams, price charts, and buy-and-sell flows with Stripe and Apple Pay.

Education

Bachelor's degree in Industrial Management, Donetsk State Academy of Management, Ukraine

Languages

English - Upper-Intermediate (B2), Russian - Native, Ukrainian - Fluent
