Summary

Senior iOS Engineer with 13 years of experience in consumer apps, both new product launches and a large app used by millions of people. Takes features from product idea and architecture to App Store release, and extracts existing ones into separate modules and an SDK shared across apps. Now focused on AI on iOS: LLM features in apps and a system for building iOS apps with AI agents.

Skills

iOS: Swift, SwiftUI, UIKit, Objective-C, Swift Concurrency (async/await), GCD, Combine, StoreKit 2, CloudKit, watchOS, CarPlay, MVVM, Clean Architecture, SDK Development

Testing & Release: XCTest, Swift Testing, Unit Testing, Integration Testing, CI/CD, A/B Testing, Firebase, PostHog

AI: AI-Assisted Development, Agentic Engineering, Claude Code, Codex, MCP, LLM Integration

Experience

Senior iOS Engineer | Independent | Kyiv, Remote | Jul 2026 - Present

Agentic SDLC for iOS | A framework for AI-driven iOS development

AI agents plan, implement, and test each feature of an iOS app through to App Store release. Designed and built the system.

- Used it to ship two App Store apps: DriveCheckUA, a CarPlay safety app, and OneCart Family, a shared family shopping list. A third app is on TestFlight.
- Every iOS change is built and tested automatically, the same way locally and in the cloud.
- A feature is accepted only after an independent review, and in DriveCheckUA a requirement without a test fails the build.

Swift, SwiftUI, Agentic Engineering, Coding Agents, LLM Integration

Senior iOS Engineer | GlobalLogic (contract) | Kyiv, Remote | Jan 2026 - Jul 2026

Voice AI assistant on Apple Watch

An AI voice assistant on Apple Watch that helps field workers organize their workday hands-free. Owned the Apple Watch app end to end.

- Built the voice interface on the watch and mapped structured LLM responses to on-screen actions, alerts, and haptics.
- Developed work-site maps for the watch: hazard areas drawn as polygons, compass-guided navigation, and arrival detection on the iPhone.
- Designed and built a custom emergency flow on watchOS.
- Implemented real-time audio streaming between the watch and the AI backend through an iPhone companion app.

Voice AI, LLM Integration, Structured Outputs, SwiftUI, WatchKit, WatchConnectivity, WebSockets

Senior iOS Engineer | PASHA Holding | Kyiv, Remote | Apr 2022 - Jan 2026

Birmarket | Online marketplace

Birmarket started as Umico and grew to 2M+ customers. Delivered marketplace features and, in the Loyalty team, built Premium Subscription and expanded it from a single feature into a full module.

- Built features across the app in UIKit and SwiftUI, including networking and deep-link navigation, and migrated screens from UIKit to SwiftUI.
- Extracted feature modules and shared infrastructure from the monolith into Swift Packages, fixing memory leaks, retain cycles, and UI hangs along the way.
- Rebuilt Premium Subscription as a Swift Package SDK with SwiftUI and Clean Architecture, then shipped it in three apps: the marketplace, a banking app, and a payment wallet. Each host opens it through one entry point with a scoped token, and the SDK runs its own networking.
- Reviewed code, onboarded new iOS engineers, and set up A/B tests and feature flags. Took on-call crash-monitoring shifts for an app that stayed above 99.9% crash-free.

SwiftUI, UIKit, Combine, Swift Concurrency (async/await), Swift Package Manager (SPM), SDK Development, Clean Architecture, CI/CD, A/B Testing, PostHog, APNs

Senior iOS Engineer | Drinkit | Kyiv, Remote | Feb 2020 - Feb 2022

Drinkit app | Digital-first coffee brand

Drinkit is an app-first coffee brand, now with 250+ coffee shops. Assembled the mobile team and built the iOS app from scratch with them.

- Shipped menu, ordering, and pickup in UIKit for the opening of the first coffee shop, and kept developing the app, which took nearly all orders, as the chain grew to eight shops.
- Owned the dynamic menu, the app's signature feature: client-side logic composed each customer's menu from the backend catalog based on their preferences and the time of day, with looping drink videos cached for offline use.
- Built much of the drink customization, including client-side price calculation. Handled App Store releases, set up CI for them, and wrote unit tests for pricing and cart state.

Swift, UIKit, GCD, MVP (Model-View-Presenter), AVFoundation, Payment SDK Integration, Unit Testing, GitLab CI, A/B Testing

Senior iOS Engineer | SOLVVE | Kyiv, On-site | Jan 2019 - Feb 2020

PLAYHERA | Esports tournament platform

PLAYHERA was an international esports platform for organizing online tournaments. Developed features for the existing iOS app in the product team, mainly in tournament management.

- Built standings, profile, and news features in UIKit, following the app's feature-module architecture.
- Reviewed teammates' code and contributed to App Store releases.

Swift, UIKit, Auto Layout, Code Review

iOS Developer | Early commercial work | Kyiv | Dec 2013 - Nov 2018

Started in Objective-C and moved to Swift. Worked both as the only iOS developer, taking apps from requirements to release, and in product teams on existing codebases. Projects covered consumer, healthcare, and e-commerce apps, plus Bluetooth hardware R&D. Shipped most of them to the App Store and kept several updated after release.

- Developed the apps in UIKit with custom interfaces, Auto Layout, navigation, and REST API integration.
- Used many Apple and third-party frameworks, including Core Data, Core Location, SceneKit, AVFoundation, CoreBluetooth, Alamofire, SnapKit, and Google Maps SDK.

Objective-C, Swift, SnapKit, CoreBluetooth, SceneKit, Core Data, Core Location, Apple Pay, Stripe
